Why a Fountain?

Moving water... a source of fascination since ancient times, is still a marvelous tool for humanizing an area today. Fountains bring us closer to nature. As one gazes upon the ever-changing patterns formed by falling water, never ending vistas for the soul paint interesting and serene images in our minds. Sunlit rainbows are formed during daylight, while at night, sparkling diamonds of light. A naturally soothing music is continuously played by the dancing water. And it is, always, a landmark!

How we can help.

An expert on your design team helps make the water feature affordable, without you losing creative control. During schematic design reviews we review your concept for display characteristics, feasibility, and cost factors. Design development then focuses on the concept followed by detailed contract documents coordinated with the designer and other consultants. We offer construction support with start up assistance assuring proper operation and adjustment. Operations and maintenance manuals further assist the operating personnel. Fully instrumented test pools, special water features and mock-ups can be developed. Formosa Fountains provides not only alternatives, but dependability.

History of Formosa Fountains.

Formosa Fountains started as independent fountain consultants with more than 45 years experience specializing in the technical design of all types of fountain water features. Being an early adopter of CAD technology and documentation modularization, Formosa has grown into a professional design firm providing engineering assistance to architects, landscape architects, and developers. Our comprehensive engineering ensures a high quality, trouble free installation with reliable operation.

What do we provide?

We translate your aesthetic direction into the plans and specifications needed to construct your fountain. Our engineering depicts the hydraulic, mechanical, and electrical system designs the fountain needs using the best fountain equipment available. We supply pool plans, piping diagrams, elevations, sections, details, equipment space layout, piping penetrations, lighting layouts, panel board layouts, wiring diagrams, etc... This enhances the competitive bid environment for the contractors and will more than offset our modest design fee.
